Lift Shuttle System

Fast lifting with or without travelling movement

If lifting, travelling, turning, horizontal shifting or a combination of these actions is required: our transport system is the ideal link to our individual machine solutions. A sturdy industrial modular system allows universal use of our lift, shuttle and lift shuttle conveyors for all batch sizes, whether single or double, pressed or loose, wet or dry. Being an important interface between individual processing steps our lift shuttle systems improve operational reliability.

Intelligent solutions improve availability

During installation, the belt mounting is optimally adapted to the press, conveyor belts and dryers. Gaps between individual machines are minimised. The endless belt provides longer operating life and more gentle fabric treatment.

Changing the belt is simple, as it can be pulled off to the side. Constant readjustment of position switches is no longer required. The robust lifting column is hot galvanised, the guide panels made of stainless steel.

Down-time caused by waiting time is reduced

Extremely short travelling and lifting times due to frequency controlled high speed drives. Fast, accurate and constant belt positioning. The multi-belt version can also be used as a (mobile) batch buffer.

The Result:

Ancillary times will be minimised, your dryer output will increase.

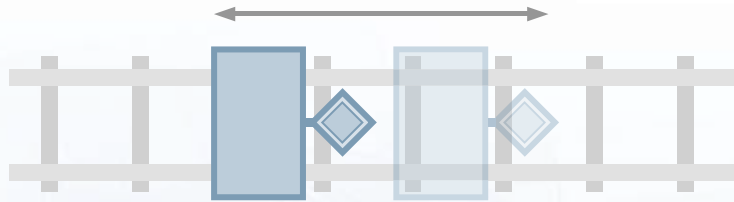

NetLink control ensures secure work flow

The touch screen panel supports simple and faultless control. The international CAN bus standard and the NetLink Control will ensure an optimum and smooth item flow through all Kannegiesser machines.
